w polypeptide specific for pathogenic Neisseria useful in therapeutic preventative vaccines and for diagnosis
                                                                                                                                                                                                                                                                        pathogenic
their
                                                                                                                                                                                                                                                                    The present sequence encodes a protein that is specific for pathogenic strains of Neisseria. The polymodicotides, polypeptides, or their antiqenic fragments, are used in vaccines to treat or protect against Neisseria infections, particularly by N. meningitidis. The polymodic sequence is also used for recombinant production of the polypeptide and to produce attenuated Neisseria strains that overexpress it, or express it in a non-toxic mutant form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            009

represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AA25457 to AA254576 and AA254616 to AA255473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the be used to screen for agonists, or natagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2457

                                                                                                                                                                                                                                                                                                              represent novel Neisseria meningitis and N. genorrheae polynuciectides and polypeptides. AAZ5457 to AAZ5457 and AAZ54516 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2022
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2322
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2382

                                                                                                                                                                                                                                   The invention relates to methods for the heterologous expression of Neisserial proteins from Neisseria meningitidis and Neisseria gonorrhoeae. At least one domain in the protein is deleted, e.g. the leader peptide, and may be replaced by a domain from a different protein to make a fusion protein, in order to enhance heterologous expression of Neisserial proteins. Also, a region of a protein, such as a poly-glycine stretch, can be mutated to enhance expression. The proteins used in the processes include ORF46.1, 287, 741, 919, 953, 961 and 983. Sequences ASA33808-AAS43905 represent DNA molecules encoding Neisserial proteins and peptide regions of proteins of the invention.

The present invention relates to a method for simultaneous heterologous expression of two or more Neisserial proteins which are in a fused state. The method is useful for simultaneous heterologous expression of two or more Neisserial proteins. A protein that may be unstable or poorly expressed on its own is assisted by adding a suitable hybrid partner and commercial manufacture is simplified-only one expression and purification need to be employed in order to produce two separately-useful proteins. The present sequence is a DNA encoding heisserial meningitidis (serogroup B, strain 2996) 961cL-983
                                                                                                                                                                                                                                                                                                                                                                      2142

represent specifically claimed Neisseria meningitidis genomic DNA sequences; AAA81260 to AAA81560 to AAA81260 represent specifically claimed Neisseria meningitidis genomic DNA sequences; AAA81260 to AAA81250 to AAA81254 to AAA81259 and AAA81304 to AAA81301 represent PCR primers used in the isolation of Neisseria meningitidis DNA sequences; and AAA8132 to AAA81452 represent Neisseria meningitidis DNA sequences; and AAA8132 to AAA81452 represent Neisseria meningitidis DNA sequences, and antibodies of sequences, which are all used in the examplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition of become of the identification of a sequences of vaccines against Meningococcus B; against all serotypes; and/or against all pathogenic Neissariae. Identification of sequences from the bacterium will also facilitate production of biological probes, particularly organism: specific probes. Attempts to make efficacious conflete conserved provided an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and expense antipence antipencically variable or at least more conserved than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          8703

Neisseria meningitidis B (NMB). The sequences in AAP71544 and AAP21607

Neisseria meningitidis B (NMB). The sequences in AAP71544 and AAP21607

to AAF21613 represent fragments of the NMB genomic sequence, as the sequence was too long to go in a record on its own it was split into B sequences which overlap each other at the beginning and end of each sequence by 49980 bp (i.e. the last 49980 bp of AAF21544 is repeated at the beginning of AAF21607 and so on). AAF21545 to AAF21607 are repeated at the beginning of AAF21608, and so on). AAF21545 to AAF21589 encode the consistent proteins given in AAB58550 to AAB5853, and AAF21589 to AAF21606 represent PCP primers which are used in the exemplification of the present invention. The NMB genome and fragments from it have continued activity, and can be used in vaccines and gene therapy.

Neisserial activity, and can be used in vaccines and gene therapy.

Neisserial bacteria or as a diagnostic reagent for detecting the presence of Neisserial bacteria or as a diagnostic reagent for detecting the presence of Neisserial bacteria or as a diagnostic reagent for detecting the presence of Neisserial bacteria or as a diagnostic reagent for detecting the presence of Neisserial bacteria or as a multipoles which stands frames (ORFs) or coding sequences within the NMB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which are more effective in vaccines than the outer membrane proteins currently
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  263658
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   2442
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1963 CTGCTGGCTTCCCTCGACAGCGTCGAAAAACAGCGGGCAGTGAAGGCGACACCCTGTCC 2022

The invention relates to methods for the heterologous expression of Neisserial proteins from Neisseria meningitidis and Neisseria proteins from Comain in the protein is deleted, e.g. the leader peptide, and may be replaced by a domain from a different protein to make a fusion protein, in order to enhance heterologous expression of Neisserial proteins. Also, a region of a protein, such as a poly-glycine stretch, can be mutated to enhance expression. The proteins used in the processes include ORF46.1, 287, 741, 919, 935, 961 and 983. Sequences AAS43868-AAS43905 represent DNA molecules encoding Neisserial proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CTGCTGGCTTCCCTCGACAGCGTCGAAAAACAGCGGGCAGTGAAGGCGACACGCTGTCC 1965

At least one domain in the protein is deleted, e.g. the leader peptide, and may be replaced by a domain from a different protein to make a fusion protein, in order to enhance heterologous expression of Neisserial proteins. Also, a region of a protein, such as a poly-glycine stretch, can be mutated to enhance expression. The proteins used in the processes include ORF46:1, 287, 741, 919, 953, 961 and 983. Sequences AAS43868-AAS43905 represent DNA molecules encoding Neisserial proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2622

                                                                                                                                                                                                                                                                      The present invention relates to a method for simultaneous heterologous expression of two or more Neisserial proteins which are in a fused state. The method is useful for simultaneous heterologous expression of two or more Neisserial proteins. A protein that may be unstable or poorly expressed on its own is assisted by adding a suitable hybrid partner and commercial manufacture is simplified-only one expression and purification need to be employed in order to produce two separately-useful proteins. The present sequence is a DNA encoding Neisseria meningitidis (serogroup B, strain 2996) delta G983-741

                                                                                                                                                                                                                        The present invention relates to a method for simultaneous heterologous expression of two or more Neisserial proteins which are in a fused state. The method is useful for simultaneous heterologous expression of two or more Neisserial proteins. A protein that may be unstable or poorly expressed on its own is assisted by adding a suitable hybrid partner and commercial manufacture is simplified only one expression and purification need to be employed in order to produce two separately-useful proteins. The present sequence is a DNA encoding Neisseria meningitidis (serogroup B, strain 2996) delta G741-983 fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2382

                                    The invention relates to methods for the heterologous expression of Neisserial proteins from Neisseria meningitidis and Neisseria gonorrhoeae. At least one domain in the protein is deleted, e.g. the leader peptide, and may be replaced by a domain from a different protein to make a fusion protein, in order to enhance heterologous expression of Neisserial proteins. Also, a region of a protein, such as a poly-glycine stretch, can be mutated to enhance expression. The proteins used in the processes include ORF46.1, 287, 741, 919, 953, 961 and 983. Sequences AAS43808-AAS43905 represent DAM molecules encoding Neisserial proteins and peptide regions of proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2502

                                                                                                     The present invention relates to a method for simultaneous heterologous expression of two or more Neisserial proteins which are in a fused state. The method is useful for simultaneous heterologous expression of two or more Neisserial proteins. A protein that may be unstable or poorly expressed on its own is assisted by adding a suitable hybrid partner and commercial manufacture is simplified-only one expression and purification need to be employed in order to produce two separately-useful proteins. The present sequence is a DNA encoding Neisseria meningitidis (serogroup B, strain 2996) 961c-983 fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2382

Neisserial proteins from Neisseria meningitidis and Neisseria gonorrhoeae. At least one domain in the protein is deleted, e.g. the leader peptide, and may be replaced by a domain from a different protein to make a fusion protein, in order to enhance hererologous expression of Neisserial proteins. Also, a region of a protein, such as a poly-glycine stretch, can be mutated to enhance expression. The proteins used in the processes include ORF46.1, 287, 741, 919, 953, 961 and 983. Sequences AAS43808-AAS43905 represent DNA molecules encoding Neisserial proteins and peptide regions of proteins of the invention.

state. The method is useful for simultaneous heterologous expression two or more Neisserial proteins. A protein that may be unstable or poorly expressed on its own is assisted by adding a suitable hybrid partner and commercial manufacture is simplified only one expression ipurification need to be employed in order to produce two separately-useful proteins. The present sequence is a DMA encoding Neisseria meningitidis (serogroup B, strain 2996) delta G983-961c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             οqα
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to methods for the heterologous expression of Neisserial proteins from Neisseria meningitidis and Neisseria gonorrhoeae. At least one domain in the protein is deleted, e.g. the leader peptide, and may be replaced by a domain from a different protein to make a fusion protein, in order to enhance heterologous expression of Neisserial proteins. Also, a region of a protein, such as a poly-glycine stretch, can be mutated to enhance expression. The proteins used in the processes include ORF46.1, 287, 741, 919, 953, 961 and 983. Sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method for simultaneous heterologous expression of two or more Neisserial proteins which are in a fused state. The method is useful for simultaneous heterologous expression of two or more Neisserial proteins. A protein that may be unstable or poorly expressed on its own is assisted by adding a suitable by partner and commercial manufacture is simplified only one expression and purification need to be employed in order to produce two separately-useful proteins. The present sequence is a DNA encoding Neisseria meningitidis (serogroup B, strain 2996) 961-983 fusion

Neisserial proteins from Neisseria meningitidis and Neisseria opnorrhoeae. At least one domain in the protein is deleted, e.g. the leader peptide, and may be replaced by a domain from a different protein to make a fusion protein, in order to enhance heterologous expression of Neisserial proteins. Also, a region of a protein, such as a poly-glycine stretch, can be mutated to enhance expression. The proteins used in the processes include ORF46.1, 287, 741, 919, 953, 961 and 983. Sequences AAS43868-AAS43905 represent DNA molecules encoding Neisserial proteins

The invention relates to methods for the heterologous expression of Neisserial proteins from Neisseria meningitidis and Neisseria gonorrhoeae. At least one domain in the protein is deleted, e.g. the leader peptide, and may be replaced by a domain from a different protein to make a fusion protein, in order to enhance heterologous expression of Neisserial proteins. Also, a region of a protein, such as a poly-glycine stretch, can be mutated to enhance expression. The proteins used in the processes include ORF46.1, 287, 741, 919, 953, 961 and 983. Sequences AAS43808-AAS43905 represent DNA molecules encoding Neisserial proteins and peptide regions of proteins of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method for simultaneous heterologous expression of two or more Neisserial proteins which are in a fused state. The method is useful for simultaneous heterologous expression of two or more Neisserial proteins. A protein that may be unstable or poorly expressed on its own is assisted by adding a sultable hybrid partner and commercial manufacture is simplified only one expression and

                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              expression of two or more Neisserial proteins which are in a fused state. The method is useful for simultaneous heterologous expression of two or more Neisserial proteins. A protein that may be unstable or poorly expressed on its own is assisted by adding a suitable hybrid partner and commercial manufacture is simplified-only one expression and purification need to be employed in order to produce two separately-useful proteins. The present sequence is a DNA encoding Neisseria meningitidis (serogroup B, strain 2996) delta (983-961)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for simultaneous heterologous

                                                                                        represent novel Neisseria meningitis and N. genorrheae polynucleotides and polypeptides. AAZ4537 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (eg. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.

AAV03575-606 represent sequences that are present in Neisseria meningitidis and N. gonorrheae but not in N. lactamica, except for the enes involved in biosynthesis of the capsule polyaccharide, frpA or C, opc, porA, rotamase, sequence IC1106, IgA protease, pillin, pilC, proteins which bind transferrin and opacity proteins. The DNA sequences are responsible for the differences in pathogenicity between N. meningitidis and N. gonorrheae, specifically they include the genes that allow N. meningitidis to cross the blood-brain barrier. DNA sequences common to N. meningitidis and N. gonorrheae, but absent from N. lactamica, are responsible for colonisation and penetration of the mucosa. The DNA sequences can be used to produce probes and primers, and antibodies produced against the encoded proteins are used in standard by the continuation of the mucosase of the meningitidis of the continuation of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                             v polypeptide specific for pathogenic Neisseria useful in therapeutic
preventative vaccines and for diagnosis
                                                                                The present sequence represents a genomic fragment of Neisseria meningitidis. The specificatino describes proteins that are specific for pathogenic strains of Neisseria. The polynucleotides, polypeptides, or their antigenic fragments, are used in vaccines to treat or protect against Neisseria infections, particularly by N. meningitidis. The polynucleotide sequences are also used for recombinant production of the polypeptide and to produce attenuated Neisseria strains that overexpress it, or express it in a non-toxic mutant form. note: the present sequence is included in Claim 1, but it is those sequences that do not include the present sequence that are actually
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine;

AAZ5457 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy; ds.

```
AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54577 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 241 CCCGCCGGTCTGAAACACGCCGTAGAACAGGCGGCAGCAATCTGGAAAACCTGATGGTC 300

AAZ4537 to AAZ4576 and AAZ44616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the be used to screen for agonists or not raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves may also be used as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes methods of obtaining immunogenic

proteins from Neisseria genomic sequences. AAA81453 to AAA82414

crepresent specifically claimed Neisseria meningitidis genomic DNA

sequences; AAA81260 to AAA81303 and AAA825620 to AAB25663 represent

Neisseria DNA sequences and their corresponding proteins; AAA81254 to

AAA81259 and AAA81304 to AAA81121 represent PCR primers used in the

isolation of Neisseria meningitidis MenB polynucleotide ORF

AAA81259 and AAA81304 to AAA81121 represent PCR primers used in the

isolation of Neisseria meningitidis MenB polynucleotide ORF

AAA81251 represent Neisseria meningitidis MenB polynucleotide ORF

cromposition can be used in the exemplification of the present

invention. The nucleic acid sequences, protein sequences, and antibodies

cromposition can be used as medicament (or in the manufacture of a

medicament) for treating, preventing or diagnosing infection due to

Neisserial bacteria. For example, some of the identification of to be

composition and be used as an edicament (or in the manufacture of a

medicament) for treating, preventing or diagnosing infection due to

composition and pathogenic Neissariae. Identification of sequences

from the bacterium will also facilitate production of biological probes,

particularly organism-specific probes. Attempts to make efficacious

control of the provision of further, complete

control of particular of the provision of further, complete

control of proving an opportunity to identify secreted or surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than other more variable regions.
                                                                                                                                                                                                                                                                                                                                                                   Scarlato V;

The present invention describes mechanists in minuminguing proteins from Neissaria genomic sequences. AAA81453 to AAA82414

C proteins from Neissaria genomic sequences. AAA81453 to AAA82414

C sequences, AAA81260 to AAA81303 and AAB2563 represent

Neisseria DNA sequences and their corresponding proteins; AAA81254 to

AAA81259 and AAA81304 to AAA81321 represent PCR primers used in the isolation of Neissaria meningitidis DNA sequences; and AAA8132 to

AAA81452 represent Neisseria meningitidis MenB polynucleotide ORF sequences, which are all used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition can be used a medicament (or in the manufacture of a medicament) for treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B; against all serotypes; and/or against all pathogenic Neissariae. Identification of sequences from the bacterium will also facilitate production of biological probes, particularly organism-specific probes. Attempts to make efficacious from the bacterium will also facilitate production of further, complete conserved maniganic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface conserved than content of antigenically variable or at least more conserved than other when we have an entities of the manufacture of the manu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
